PHYSICS 5054/42

Paper 4 Alternative to Practical

May/June 2019

1 hour

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

2

BLANK PAGE

1 A student determines an approximate value for the specific heat capacity of water by an electrical method.

The specific heat capacity of a substance is the amount of thermal energy needed to raise the temperature of 1 g of the substance by 1 °C.

He sets up the apparatus as shown in Fig. 1.1.

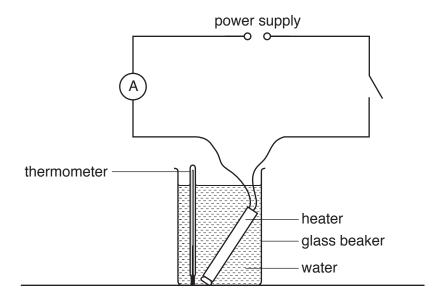

Fig. 1.1

- He pours a mass m of water into a beaker, where $m = 100 \,\mathrm{g}$.
- He places a heater into the water in the beaker.
- He connects a voltmeter to measure the potential difference across the heater.
- (a) Draw a voltmeter symbol on the circuit diagram of Fig. 1.1 to show the voltmeter measuring the potential difference across the heater. [1]

(b) The student measures the initial temperature of the water and records it at time t=0 in Table 1.1.

Table 1.1

time t/s	temperature θ/°C
0	21.5
60	27.0
120	32.0
180	37.0
240	
300	45.5
360	48.5

- He closes the switch, starts a stopwatch and records the temperature θ of the water every 60 s for 6 minutes.
- He records the current *I* in the heater and the potential difference *V* across the heater.

His measurements are:

$$I = 4.0 \,\mathrm{A}$$
 $V = 14.8 \,\mathrm{V}$.

- He opens the switch.
- (i) The reading of the thermometer at time $t = 240 \,\mathrm{s}$ is shown in Fig. 1.2.

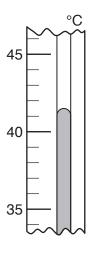

Fig. 1.2

Read the thermometer and record the temperature in Table 1.1.

[1]

- (ii) State why it is important to:
 - 1. ensure that the heating coil is completely immersed in the water

stir the water before recording each temperature.

2.

heating.

Fig. 1.3

(ii) Use your graph to calculate the temperature rise $\Delta\theta$ of the water in the first 200s of

[4]

 $\Delta \theta =$ [2]

(d)	(i)	Calculate the thermal energy E supplied by the heater in the first 200 s and give the unit. Use the equation shown:
		$E = V \times I \times t$
		<i>E</i> =[1]
	(ii)	Calculate a value for the specific heat capacity c of water. Use the mass given at the start of this question, your answers to (c)(ii) and (d)(i) , and the equation:
		$E = m \times c \times \Delta \theta$
		$c = \dots J/(g ^{\circ}C)$ [2]
(e)	(i)	The specific heat capacity of water is 4.2 J/(g °C).
		Examine the apparatus set-up shown in Fig. 1.1.
		Suggest one practical reason why your calculated value of c is inaccurate.
		[1]
	(ii)	State one improvement to the apparatus that produces a more accurate result.
		[1]
(f)	Anc	other student repeats the experiment and forgets to switch off the heater at the end of the
		eriment. The temperature of the water continues to rise until it reaches 82°C and then pains constant at this value.
	Sug 82°	gest one reason why the temperature of the water stops increasing when it reaches C.

2 A student uses a ray box to investigate the refraction of a ray of blue light as it passes through a glass prism.

He sets up the apparatus as shown in Fig. 2.1 on a piece of paper.

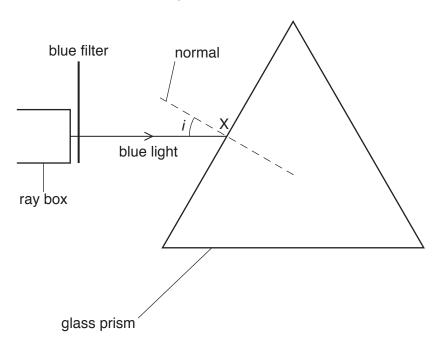

Fig. 2.1

(a)	Measure the angle	of incidence	<i>i</i> of the ray	on the	prism at	point X.
-----	-------------------	--------------	---------------------	--------	----------	----------

i = [1]

(b) The angle of refraction at X is 19°.

On Fig. 2.1:

(i) Draw the refracted ray inside the prism.

(ii) Mark with the letter Y, the point where the refracted ray emerges from the prism. Draw the normal at point Y. [1]

(c) The ray emerges from the prism at Y.

Describe how the student can mark the path of the emergent ray accurately on the paper.

[Total: 4]

[1]

3 A student investigates the maximum height *h* to which a ball bounces after hitting a laboratory bench.

She sets up her apparatus as shown in Fig. 3.1.

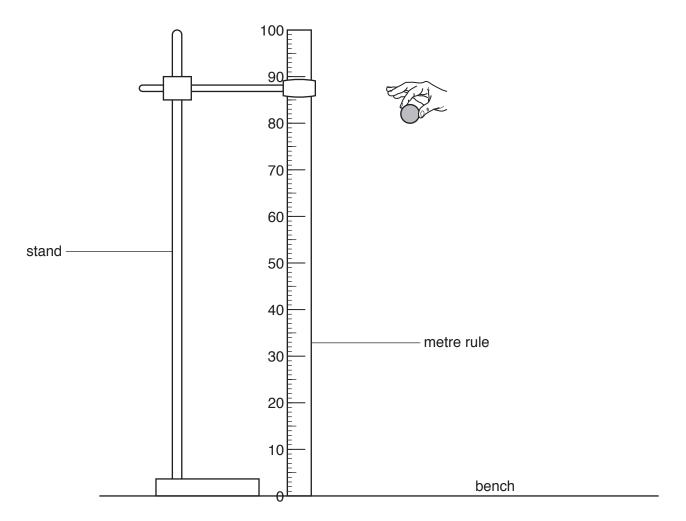

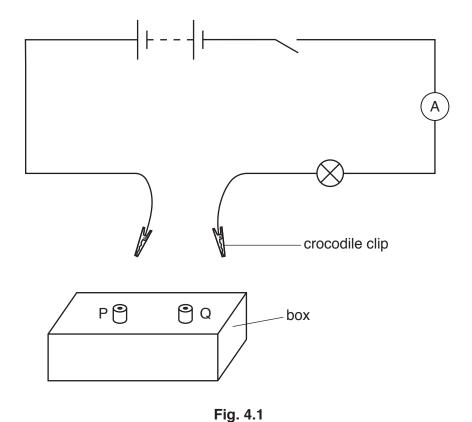

Fig. 3.1

			9		
(a)	She	drops the ball from a height	of 80 cm above th	e bench, as shown in Fig. 3.1.	
	Afte	er one bounce, the ball reach	es a maximum hei	ght <i>h</i> of 55 cm.	
	(i)	On Fig. 3.1, draw the ball w	hen <i>h</i> = 55 cm.		[1]
	(ii)	On Fig. 3.1, draw the position height of 55 cm.	on of the student's	s eye placed correctly to view th	e ball at a [1]
(b)	She	repeats this procedure three	e more times and o	obtains the following results for h	1:
		54 cm	57 cm	53 cm	
	(i)	Use all her results to find th	e mean value of th	ne maximum height <i>h</i> reached.	
		Give your answer to an app	ropriate number o	significant figures.	
			mean value for h	=	cm [2]
	(ii)	The student uses a metre ru	ule graduated in m	illimetres.	
		Suggest why her results are	e not recorded to t	ne nearest millimetre.	
					[1]
(c)	The	student repeats the procedu	ire but now drops	the ball from a height of 10 cm.	
	Sug	gest why she now finds the r	maximum height re	eached difficult to measure.	
					[1]
					[Total: 6]

4 A box contains an unknown electrical component. This component is connected to two terminals P and Q on the outside of the box.

A battery, an ammeter, a switch, a lamp and two crocodile clips are connected as shown in the circuit diagram of Fig. 4.1.

The unknown component is either a broken wire or a connecting wire or a diode.

(a) Describe how to use the apparatus to determine whether the component in the box is:

(i)	a broken wire	
(ii)	a connecting wire	
(iii)	a diode.	ניו
		[1]

(b)	The component in the box is a low resistance connecting wire. A second box looks identical, but contains a higher resistance resistor.
	Describe how to use the apparatus to determine which box contains the resistor.
	[1]
	[Total: 4]
